

Mac on a PC

We have been let down by Microsoft. Each new edition of operating system and office suite has been like a kick in the teeth!

While Microsoft have been focused on tormenting us, Apple have really been thinking about what a computer should do.

When Apple brought out OSX, they used the open-source core, UNIX. This is what I have been waiting for, for years. Unix is fast, no messing software. It is secure as no program can access the kernel without first logging in as 'root' (special startup required). The Mac Operating system has been very well thought out. It's easier and more intuitive to use and it CAN provide all your media, communication and office needs. So, what's this leading to??

Well some clever people have been tweaking the operating system to work with PC's. I've been able to get hold of a copy and installed it on a few computers.

I was quite amazed really when it first worked and imagined that it probably wouldn't work properly. I was wrong, it works just like a mac! The only thing it won't do is bong when you turn it on.

Most reasonably modern PC's and laptops will work, some will need a component changed and a few just won't be compatible. Of course I can supply new equipment intended for a mac install.

I would recommend using this as the day to day, Email, Internet and Office computer. Then use the PC for those special tasks that only a PC with its huge range of functions can manage.

This is going to be a Tsunami!!

Dell Dimension 3000
P4 2,8Ghz Single Core
512MB Ram, 160GB HDD
Windows XP Pro, + programs.
Boot Times After Refurb.
0 - logon screen: 32 seconds
- processor rests: 19 seconds
- web home page: 13 seconds
Total Boot - Web: 64 seconds

"Never judge a program by looking at the shortcut."

Testimonials: I haven't one in this issue, nor the last. I'd like someone to send me one and I promise to copy it word for word. It would be interesting to get one with some positive criticism

Banbury and surrounding villages will have had their Broadband upgraded by July this year. We should all enjoy speeds of between 5 and 8 Mb/s.

www.carlsplanet.co.uk
 Latest website I have been involved in creating.

After a quick crash course from me, Carl was able to create all his additional pages. The reason they look so good is testament to him only.

New Logo

I have slightly changed my logo and headers and will be re-doing my website soon. I am also printing cling vinyl stickers for the inside of car or shop windows. For anyone who wants to sport one of these, (10cm x 6.7cm) I will
